# Intro to NeoMatrix

---

Week 1 Exercises

# Building and Programming robots in TINKERCAD

**This week you be introduced to the NeoMatrix through TinkerCAD.  
This workshop aims to develop your text programming skills.**

Please complete the bronze requirements before starting the silver,  
and complete the silver before starting the gold.

# Getting started

Activity containing  
pre-made circuit

The screenshot displays the 'Aber Robotics Club 23-24' interface. At the top, there is a back arrow and the title 'Aber Robotics Club 23-24' with the teacher 'AberOutreach'. Below this is a navigation bar with tabs: 'Students', 'Activities' (highlighted with a 'New!' badge), 'Designs', 'Notifications', and 'Co-teachers'. The main section is titled 'Recent class Activities' and contains three activity cards: 'Neo-Matrix' (dark blue), 'Valiants' (green), and 'Electronics' (blue). Each card shows the activity name and the date it was added. A blue arrow points from the text box on the left to the 'Neo-Matrix' card.

| Activity Name | Date Added         |
|---------------|--------------------|
| Neo-Matrix    | Added Jan 9, 2024  |
| Valiants      | Added Jan 9, 2024  |
| Electronics   | Added Dec 13, 2023 |

# Getting Started

# Neopixel and GFX APIs

- NeoPixel:  
[https://adafruit.github.io/Adafruit\\_NeoPixel/html/class\\_adafruit\\_-\\_neo\\_pixel.html](https://adafruit.github.io/Adafruit_NeoPixel/html/class_adafruit_-_neo_pixel.html)
- GFX API: [http://adafruit.github.io/Adafruit-GFX-Library/html/class\\_adafruit\\_\\_\\_g\\_f\\_x.html#a59178a0e0c845a14a39b457c43567dd9](http://adafruit.github.io/Adafruit-GFX-Library/html/class_adafruit___g_f_x.html#a59178a0e0c845a14a39b457c43567dd9)

# Key functions

- `matrix.fillScreen(matrix.Color(r,g,b));`
- `matrix.drawPixel(x,y,matrix.Color(r,g,b));`
- `matrix.fillRect(x, y, width, height, color);`
- `matrix.drawRect(x, y, width, height, color);`
- `matrix.fillCircle(center_x, center_y, radius, color);`
- `matrix.drawCircle(center_x, center_y, radius, color);`
- `matrix.clear();`
- `matrix.show();`

# BRONZE Challenge:

## Steps:

1. Fill in the function to generate a random colour
  - a. The arduino function to generate a random number is:  
`random(lowerLimit, upperLimit);`
  - b. The matrix function to encode a colour is:  
`matrix.Color(r, g, b);`
2. Use the random colour function to fill the whole screen with a different colour each time through the loop

# SILVER Challenge:

## Steps:

1. Write a function that will colour each pixel with a different random colour. This function itself shouldn't include the `matrix.show()` this will be done after the function is called

Remember to use a nested for-loop to cycle through all the pixels in the matrix

```
drawPixel (int16_t x, int16_t y, uint16_t color)
```

Where the colour is generated by a call to your random colour function

2. Call your new function from your loop and call the show function to update the display

# SILVER Challenge:

## Steps:

1. Write a function that will colour all the pixels in a column on the grid the same colour. The full matrix should then be filled with a different colour on each column.
2. Write a function that will colour all the pixels in a row on the grid the same colour. The full matrix should then be filled with a different colour on each row.
3. Call your functions from inside your main loop

# GOLD Challenge:

## Steps:

1. Using either `drawCircle` or `fillCircle`, draw a selection of circles in random positions and sizes across the matrix. Each circle should be drawn with a different random colour. Add a default parameter to your function to specify how many circles to draw, and a second parameter to specify the maximum circle radius.

Remember the function should not directly update the display

```
drawCircle (int16_t x0, int16_t y0, int16_t r, uint16_t color)  
fillCircle (int16_t x0, int16_t y0, int16_t r, uint16_t color)
```

# GOLD Challenge:

## Steps:

2. Using either `drawRect` or `fillRect`, write a function that will draw a set of rectangles inside each other on the matrix. Each rectangle should use a random colour.  
Remember to use width and height so your function adapts to different matrix sizes.  
The function itself should not directly update the display.

```
drawRect (int16_t x, int16_t y, int16_t w, int16_t h, uint16_t color)  
fillRect (int16_t x, int16_t y, int16_t w, int16_t h, uint16_t color)
```

# Extension Challenge:

## What else can you add to this program?

- Add a parameter with a default value to your functions that draw circles to switch between drawing circle outlines or filling in the circles
- Write a function that draws a circle where the outline is a different colour to the fill
- Use combinations and/or variations of the functions generated here to produce different effects. Think about whether to clear the screen or not between different function calls for different effects
